                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             eggregation.
-!- SUBUNIT: Hexamer containing 2 sets of 3 nonidentical chains (alpha, beta and gamma), linked to each other by disulfide bonds.
-!- PTM: Conversion of fibrinogen to fibrin is triggered by thrombin, which cleaves fibrinopeptides A and B from alpha and beta chains, and thus exposes the N-terminal polymerization sites responsible for the formation of the soft clot. The soft clot is converted into the hard clot by factor XIIIA which catalyzes the epsilon-(gamma-glutemyllysine cross-linking between gamma chains (stronger) and between alpha chains (weaker) of different
                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MEDLINE=79164394; PubMed=434821;

-!- SUBUNIT: Hexamer containing 2 sets of 3 nonidentical chains (alpha, beta and gamma), linked to each other by disulfide bonds.
-!- PTM: Conversion of fibrinopen to fibrin is triggered by thrombin, which cleaves fibrinopetides A and B from alpha and beta chains, and thus exposes the N-terminal polymerization sites responsible for the formation of the soft clot. The soft clot is converted into the hard clot by factor XIIIA which catalyzes the epsilon-(gamma-glutamyl) lyabhe cross-linking between gamma chains (stronger) and between alpha chains (weaker) of different
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 similarity).

"Complementary DNA sequence of lamprey fibrinogen beta chain.";

Biochemistry 25:6512-6516(1986).

-!- FUNCTION: Fibrinogen has a double function: yielding monomers that polymerize into fibrin and acting as a cofactor in platelet
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                aggregation.

Subunir: Hexamer containing 2 sets of 3 nonidentical chains (alpha, beta and gamma), linked to each other by disulfide bonds. PTM: Conversion of fibrinogen to fibrin is triggered by thrombin, which cleaves fibrinopeptides A and B from alpha and beta chains, and thus exposes the N-terminal polymerization sites responsible for the formation of the soft clot. The soft clot is converted into the hard clot by factor XIIIA which cacalyzes the epsilon-(gamma-glutamy)lysine cross-linking between gamma chains (stronger) and between alpha chains (weaker) of different
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

PTM: Conversion of fibringen to fibrin is triggered by thrombin, which cleaves fibrinopeptides A and B from alpha and beta chains, and thus exposes the N-terminal polymerization sites responsible for the formation of the soft clot. The soft clot is converted into the hard clot by factor XIIIA which catalyzes the epsilon-(gamma-glutamyl)lysine cross-linking between gamma chains (stronger) and between alpha chains (weaker) of different
                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SEQUENCE OF 25-63.

PTM: Conversion of fibrinogen to fibrin is triggered by thrombin, which cleaves fibrinopeptides A and B from alpha and beta chains, and thus exposes the N-terminal polymerization sites responsible for the formation of the soft clot. The soft clot is converted finto the hard clot by factor XIIIA which catalyzes the epsilon-(gamma-glutemny) lysine cross-linking between gamma chains (stronger) and between alpha chains (weaker) of different
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

n (with alpha) (By similarity).
                                                                aggregation.
SUBUNIT: Hexamer containing 2 sets of 3 nonidentical chains
SUBUNIT: Hexamer containing 2 sets of 3 nonidentical chains
(alpha, beta and gamma), linked to each other by disulfide bonds.
PIM: Conversion of fibrinogen to fibrin is triggered by thrombin, which cleaves fibrinopeptides A and B from alpha and beta chains, and thus exposes the N-terminal polymerization sites responsible for the formation of the soft clot. The soft clot is converted into the hard clot by factor XIIIA which catalyzes the epsilon-(gamma-glutamyl)lysine cross-linking between gamma chains (stronger) and between alpha chains (weaker) of different
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ą
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

I FUNCTION: Transcriptional activator that binds to the regulatory region of MMP3 and thereby controls stromelysin expression. It stimulates the activity of various transcriptional activators as JUN, SPI, PAX6 and ETS1, suggesting a function as a coactivator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ISOIG=Q9UGUO-2; Sequence=VSP 003984, VSP 003985;
-1- TISSUE SPECIFICITY: Expressed in most tissues, except in ovary and prostate. Isoform 1 is exclusively expressed in brain, heart and testis, and this form predominates in liver and kidney. Isoform 2 predominates in lung.
-1- DOWAIN: The atypical PHD domain functions as a negative modulator of cofactor binding (By similarity).
-1- SIMILARITY: Contains 1 PHD-type zinc finger.
-1- SIMILARITY: Contains 1 PHD-type zinc finger.
-1- CAUTION: Ref. 4 sequence differs from that shown due to a

Interaction between the transcription factor SPBP and the positive Triteraction between the transcription factor SPBP and the positive Triteraction between the transcription factor SPBP and the positive RT offactor RNP4. An interplay between protein binding zinc fingers:";

J. Biol. Chem. 275:26144-26149 (2000).

- I- FUNCTION: Transcriptional activator that binds to the regulatory region of WMP3 and thereby controls stromelysin expression. It stimulates the activity of various transcriptional activators such as JUN, SPI, PAX6 and ETSI, suggesting a function as a coactivator.

- SUBUNIT: Homodimer (Probable). Interacts with RNP4 and JUN. Binds to the regulatory region of MMP3.

- I- SUBCELLUIAR LOCATION: Nuclear. This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the ENBL outstation the Buropean Bioinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@lb.sib.ch). P->S: Loss of interaction with RNF4; when associated with T-1629, R-1736 and V-A->T: Loss of interaction with RNF4; when R EMBL; U20282; AAA6495.1; ALT_SEO.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      jannachii.";
Science 273:1058-1073 (1996).
-!- FUNCTION: Part of ribonuclease P, a protein complex that generates
mature tRNA molecules by cleaving their 5'ends (By similarity).
-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage of RNA, removing 5'-
extra-nucleotide from tRNA precursor.
-!- SUBUNIT: Consists of a catalytic RNA component and at least 4
protein subunits (Potential).
-!- SIMILARITY: Belongs to the eukaryotic/archaeal RNase P protein
component 4 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SEQUENCE FROM N.A.

                                                                                                                                                                                                                                                                                                                                   Corresponds to a fibrinogen beta chain C-terminal sequence. The invention corresponds to a fibrinogen beta chain C-terminal sequence. The invention relates to novel fibrinogen C-terminal peptides, peptide-09 (AAV52600), peptide-70 (AAV52693) and peptide-71 (AAV52694). These claimed peptides can be used to promote healing, and peptide-71 being the next most potent. Peptides of also found to have cell proliferative effects. The peptides can be used to promote healing of a wound in a patient. They can also be used for diseases characterised by the absence of a cellular product, e.g., diseases characterised by the absence of a cellular product, e.g., diseases characterised by the absence of a cellular product, e.g., diseases characterised by the absence of a cellular product, e.g., diseases characterised by the absence of a cellular product, e.g., diseases characterised by the absence of a cellular product, e.g., and hemophilia B (factor IX deficiency). They can also be used for the growth and transport of cells in cell culturing systems, the separation of cells into tissues or cell cultures. They can be used for producing therapeutic structures, e.g., gels, prosthetic devices or collagen sheets. The peptides can also be used as tools for performing analysis of other physiological systems, and for further research and development, for example, to identify and isolate cell receptors. The peptides can also be used in diagnosis, e.g., of blood coagulation.

The invention is useful for enhancing liposome uptake into cells or for permeability through the cell membrane using a haptotactic-peptide permeability through the cell membrane using a haptotactic-peptide liposomal composition. The invention may be particularly useful for enhancing the delivery of pharmaceutical agent into cells, for enhancing the delivery of agent into cells or for commencing delivery of cosmetic agent into cells or for commencing the delivery of cosmetic agent into cells, where the liposomes of the composition have a cosmetic beneficial effect. The present sequence is
                                                                                                                                                                             homologous to sequences found within the C-termini of fibrinogen, and which are characterised by their ability to induce cell attachment to a surface to which the peptide is bound. These are useful in the treatment of wounds and diseases, to separate different types of cells in culture, to analyse cell receptor mechanisms and to design peptide-derivatised drugs. The present sequence is a known haptotactic peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Haptotactic peptide liposomal composition, useful for enhancing liposome uptake into cells, comprising peptide capable of eliciting cell attachment responses and sequence similarity to haptotatic peptides and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              haptotactic; liposomal composition; carboxy termini; fibrinogen chain; liposome; lipid bilayer; aqueous compartment; delivery; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to polymucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibt activity elating to cytokine. cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes an isolated human nucleic acid (I) encoding any of 120 10-1533 residue amino acid sequences (S1), given in the specification, comprising any of 164 179-1421 base pair sequences (S2), given in the specification. The methods and compositions of the present invention are useful for identifying, diagnosing, monitoring, staging, invention are useful for identifying, diagnosing, monitoring, staging, they are also used for identifying lung tissue, monitoring and identifying and/or designing antagonists of the polypeptide of the inng. Invention, gene therapy, production of transgenic animals and production of engineered lung tissue for treatment and research. This is the amino acid sequence of a lung specific nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated human nucleic acid molecule and polypeptide, useful for identifying, diagnosing, monitoring, staging, imaging and treating lung cancer and non-cancerous diseases of the lung.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; gene therapy, vaccine; lung specific antigen; cancer diagnosis; cancer monitoring; cancer staging; cancer imaging; lung cancer; non-cancerous diseases of the lung; transgenic animal.

The invention relates to polynuclectides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunoomodulatory activity and activity, tissue growth factor activity, immunoomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leuksemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acids encoding polypeptides with cytokine-like activities, useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human fibrinogen B-beta chain may be produced recombinantly, preferably by sheep beta-lactoglobulin signal peptide fusion protein gene expression in non-human transgenic animal milk, preferably of a sheep, pig, goat or cattle. Co-expression with the fibrinogen A-alpha chain (see AAR82244) and the gamma chain (see AAR82245) results in the production of active fibrinogen, which is useful in human and veterinary medicine, e.g. in the formulation of surgical adhesives, which also consist of Factor-XIII, and as a coating surface for polymeric articles, such as synthetic vascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorder; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Production of fibrinogen in transgenic mammals - by introducing DNA segments into the germ line of a non-human mammal and collecting milk
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                Human fibrinogen B-beta chain; transgenic animal milk; treatment; sheep beta-lactoglobulin signal peptide fusion protein; surgical adhesive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The invention relates to a novel method for diagnosing and analysing autoimmune disease or arthritides. The method comprises obtaining a Spatient sample containing mRNA, analysing gene expression using the mRNA that results in a gene expression signature of the mRNA, and using the mRNA that cereal signature to diagnose or analyse the autoimmune disease or arthritides in the patient, where gene expression of at least 60% of the genes correlates with that of the gene signature. The invention of the genes correlates with that of the gene signature. The invention of the genes for targeting in the treatment of theumatoid arthritis; identification of genes for targeting in the treatment of theumatoid arthritis; an ammmal of the cother than a mouse; diagnosis of theumatoid arthritis; diagnosis or arralyses of autoimmune disease or rheumatoid arthritis; diagnosis or analyses of autoimmune disease or rheumatoid arthritis; and reducing the symptoms associated with collagentinduced arthritis and reducing the symptoms associated with collagentinduced arthritis. The compositions of the invention have the following activities: immunosuppressive, dermatological, and immunomodulatory. The methods and compositions of the present invention are useful for methods and compositions of the present invention are useful for methods and treating autoimmune disease or arthritides, such as the manner of autoimmune disease caused by an infectious agent. This sequence represents a protein sequence relating to the genes used in the analysis and treatment of autoimmune disease or arthritides. Note: This sequence is not shown and the specification. It has been supplied in an electronic format from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     autoimmune disease; arthritide; gene expression analysis; rheumatoid arthritis; collagen-induced; immunosuppressive; antirheumatic; antiarthritic; osteopathic; antigout; antiinflammatcry; dermatological; immunomodulatory; lupus; ankylosing spondylitis; Fibrositis; fibromyalgia; osteoarthritis; gout; juvenile rheumatoid arthritis; immune; human.

The method involves contacting the nucleic acid with a complementary probe or primer. The method is useful for diagnosing or aiding in the diagnosis of vascular disease or disorder in a subject e.g. myocardial infarction, coronary artery disease, atherosclerosis, ischaemia, stroke, peripheral vascular disease, venous thromboembolism and pulmonary embolism. The present sequence is human FBG reference protein. Note: This sequence is said to be encoded by SEQ ID NO: 5 (AAD55117). However this does not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     δ

The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent of for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. We ctors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins care useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. ANU29510-AAU33304 represent the amino acid sequences of novel human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; cytokine; cell proliferation; cell differentiation; gene therapy; accine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorder; arthritis; inflammation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel method for diagnosing and analysing a utcoimmune disease or arthritides. The method comprises obtaining a CC patient sample containing mRNA, analysing gene expression using the mRNA that results in a gene expression signature of the mRNA, and using that correspond in the patient, where gene expression of at least 60% of cor arthritides in the patient, where gene expression of alleast 60% of the genes correlates with that of the gene signature. The invention of the genes for targeting in the treatment of rheumatoid arthritis; identification of genes for targeting in the treatment of rheumatoid arthritis in a mammal other than a mouse; diagnosis of rheumatoid arthritis; diagnosis or array or gene chip, specific for rheumatoid arthritis; diagnosis or array or gene chip, specific for rheumatoid arthritis; accening the cfficacy of a candidate drug in vitro for the treatment of collagentinduced arthritis, and reducing the symptoms associated with collagentinduced arthritis. The compositions of the invention have the following activities: immunsuppressive, antirheumatic, antiantides, such as call and treating autoimmune disease or arthritides, such as themselved arthritis, and treating autoimmune disease or arthritides, such as chemmatoid arthritis, and and disease caused by an infectious agent. This sequence represents a confusion of the genes used in the analysis and treatment of mine disease caused by an infectious agent. This sequence is not shown and composition. It has been supplied in an electronic format from and the propersory and the propersory of an arthritides such as the propersory of an arthritides. The composition of the genes used in the analysis and treatment of an the propersory of an arthritides. The sequence relating to the genes used in the analysis and treatment of an anthritides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                Diagnosing and analyzing autoimmune disease using gene expression profiles and microarray technology, useful for diagnosing and treating rheumatoid arthritis, lupus, fibrositis, osteoarthritis, fibromyalgia and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids encoding polypeptides with cytokine-like activities, useful in diagnosis and gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   human; liver disorder; hyperlipidaemia; hypertension; type II diabetes; tumour; liver; inflammatory disorder; immune response disorder; high-throughput screening; differential gene expression; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                      ZW;

The invention relates to a composition comprising several cDNAs that are differentially expressed in a liver disorder. The composition is useful for for treating liver disorder such as hyperlaidemia, hypertension, type II diabetes, tumours of the liver and disorders of the inflammatory and immune response. The composition is useful for a high-throughput method of screening several molecules or compounds to identify a ligand which specifically binds a CDNA. A protein encoded by the CDNA is useful for a high-throughput method for using a protein to screen several molecules or compounds to identify at least one ligand which specifically binds the protein which involves compounds under conditions to allow specific binding, and detecting specific binding between the protein and a molecule or compound, therefore identifying a ligand which specific binding, and detecting specific binding between the protein and a molecule or compound, therefore identifying a ligand which specifically binds the protein. The composition is useful for detecting and quantifying differential gene expression, can be used in gene therapy, to formulate prognosis and to design a treatment regimen and to monitor the efficacy of treatment. The present sequence represents the amino acid is a protein encoded by a cDNA differentially expressed in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                    The invention relates to polymucleotides (AAKS1456-AAKS3435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymerides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or e.g. stem cell growth factor activity, nematopoiesis regulating activity, issue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or inflammation. Note: Records for SRQ ID NO 2110 (AAKS2581), 2111 (AAKS2582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication

The invention relates to polynucleotides (AAK51456-AAK51435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to ercoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to production of location or call differentiation or which may induce production of other cytokines in other cell populations. The polymetides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
                                                                                                                                                                                                                                                                                   Nucleic acids encoding polypeptides with cytokine-like activities, useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorder; arthitis; inflammation.

                                                                                                                                                                                                                                                         à
                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                            production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
                                                                                                                                                                                        The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce
